

Duration of interphenophases in winegrapes

Domaine de Vassal

- Research vineyard in France
- Plant many varieties and clones for experiments and data collection
- Vines are planted for 5 years
- Except Chasselas

Question:

- Has the duration of interphenophases changed since the 1980s?
- If so, does the change differ between varieties?
- Interphenophase = time between phenophases (budburst to flowering)

Model

Duration.predicted $\sim N(\mu, e)$

$$\mu = a_{\text{var}} + B * \text{year}$$

$$a_{\text{var}} \sim N(\mu_{\text{var}}, \sigma_{\text{var}})$$

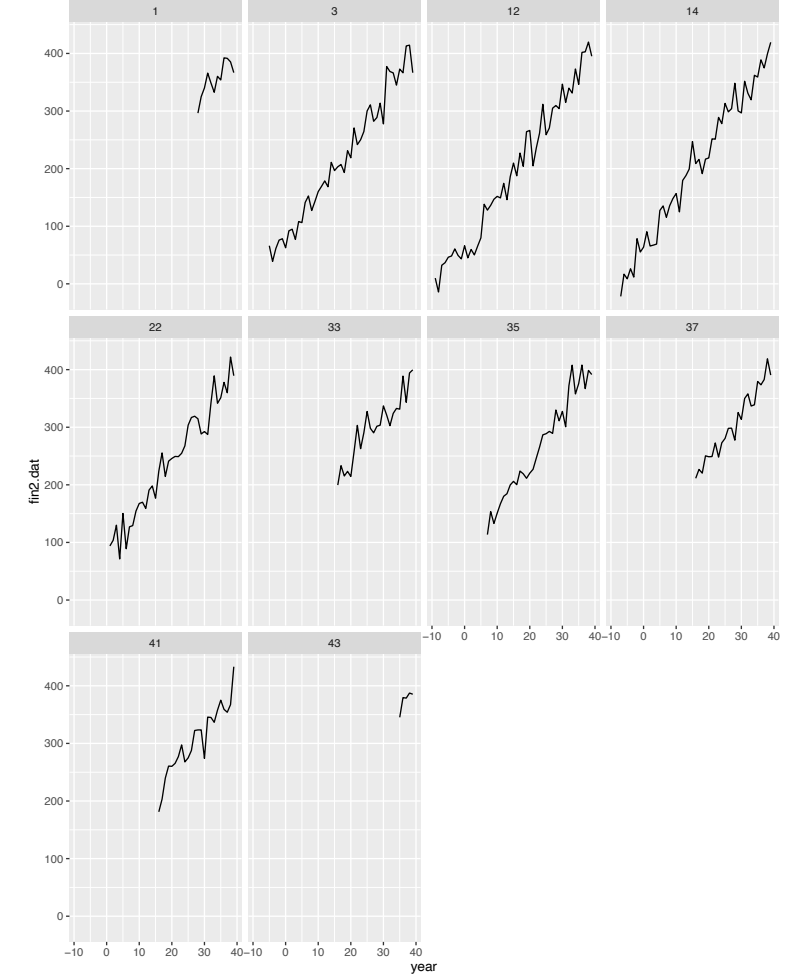

$$B \sim N(\mu_B, \sigma_B)$$

$$e \sim U(0, 20)$$

Written as an equation:

$$\text{Duration.predicted} = a_{\text{var}} + B * \text{year} + e$$

- **So each variety has unique intercept but will only draw one value from beta's distribution so all varieties have same slope (for now).**

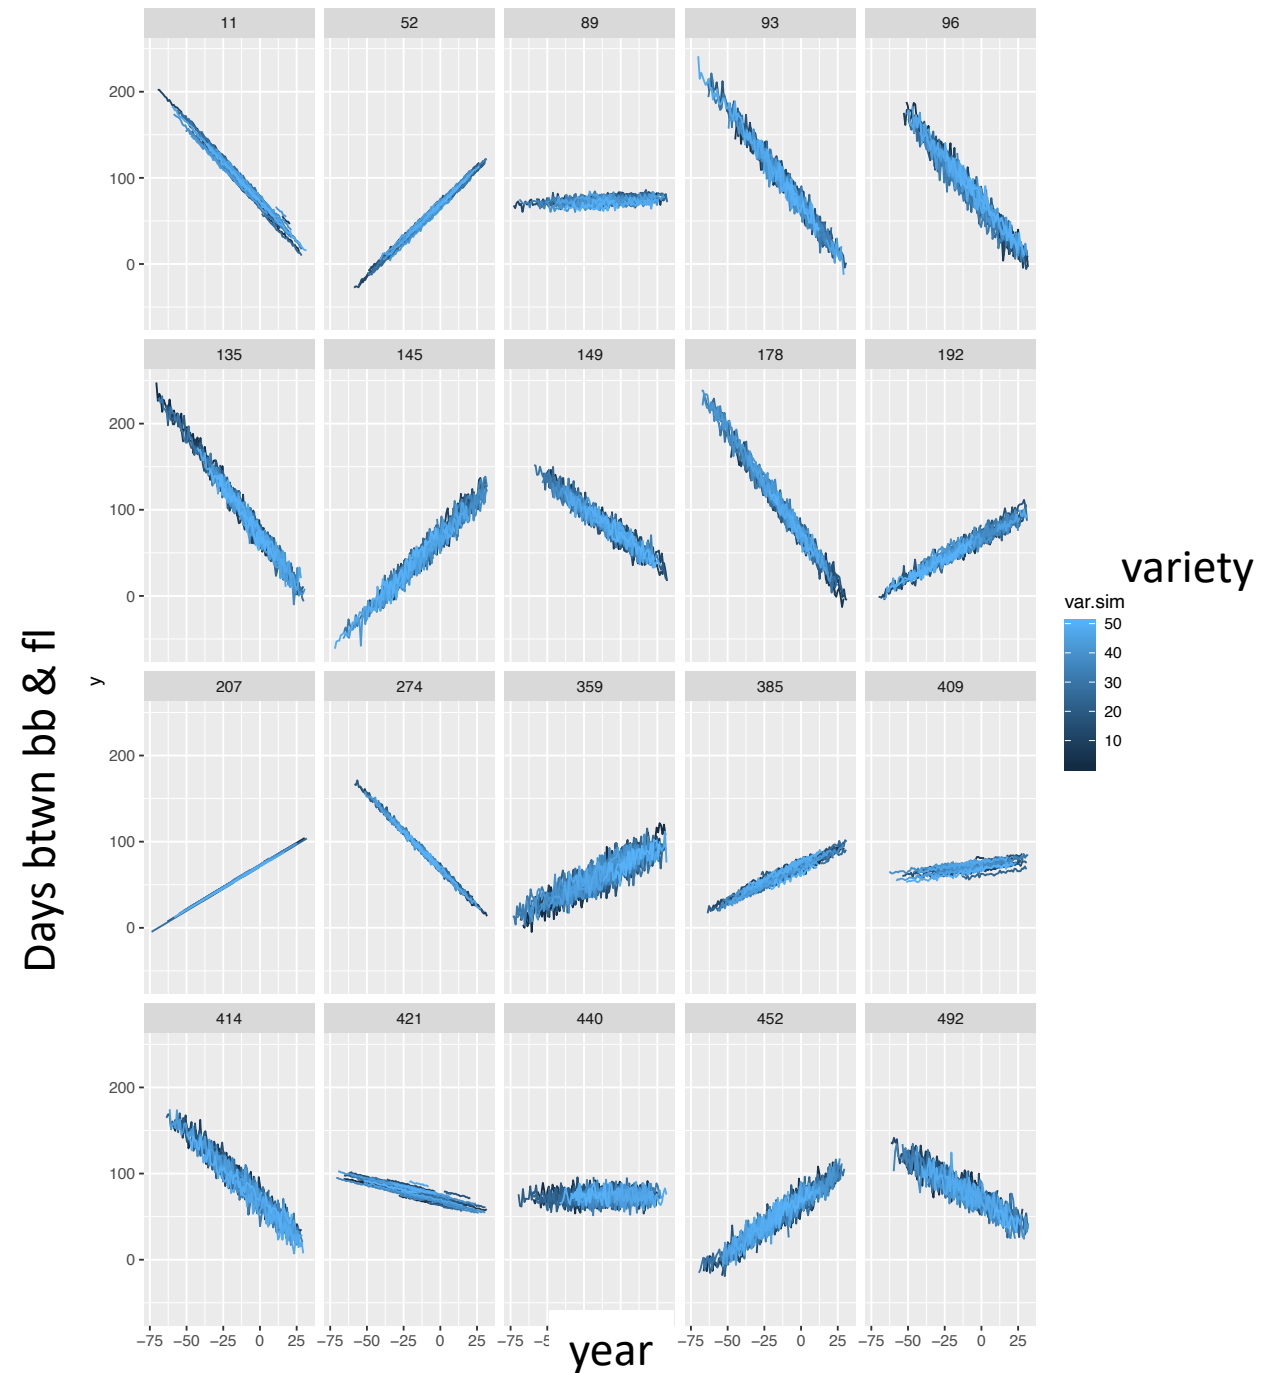

New for April 7

Examples of simulated data

Priors

- $a.\mu \sim N(70, 5)$
- $a.\sigma \sim U(0, 5)$
- $B.\mu \sim N(0, 1)$
- $B.\sigma \sim U(0, 1)$
- $E \sim U(0, 10)$

Prior

- $a.\mu \sim N(70, 2)$
- $a.\sigma \sim U(0, 2)$
- $B.\mu \sim N(0, 0.1)$
- $B.\sigma \sim U(0, 0.1)$
- $E \sim U(0, 10)$

questions

- Need to fix the year so it does not go to -80. Something to do with the start year needing to be late enough so the count down does not go lower than -24
- Need to constrain variation - Make error smaller? Slope? Intercept sigma?
